

THERE'S NO MARGIN FOR EXCESS.

Especially when it comes to successful cement cleanup. One out of five crowns fail because of secondary caries caused by biofilm accumulation. Even a tiny bit of cement left behind can cause big problems. The Calibra family of definitive cements offers a wide tack cure window of up to 10 seconds and a 45-second gel phase,* giving clinicians the time needed for thorough cleanup. And prescriptive selection based on required bond strength and material helps ensure successful restorations.

Meet the family at CalibraCement.com.
